CCTV SYSTEMS service

CCTV systems are security setups that use cameras to monitor and record activity in and around a property. They provide real-time surveillance and can help deter crime or capture evidence if an incident occurs. Regular maintenance ensures the cameras are working correctly, video feeds are clear, and storage systems are secure. Technicians also update software and troubleshoot issues to keep the system fully functional.

Access control service

Access control services involve the installation, maintenance, and management of systems that control who can enter specific areas of a building or facility. These systems often use methods like keycards, biometric scans, or PIN codes to grant access. Regular servicing ensures that the access control systems are working properly, secure, and up to date with the latest technology. Technicians perform routine checks, troubleshoot any issues, and update software to maintain security and prevent unauthorized access, helping to keep sensitive areas safe.

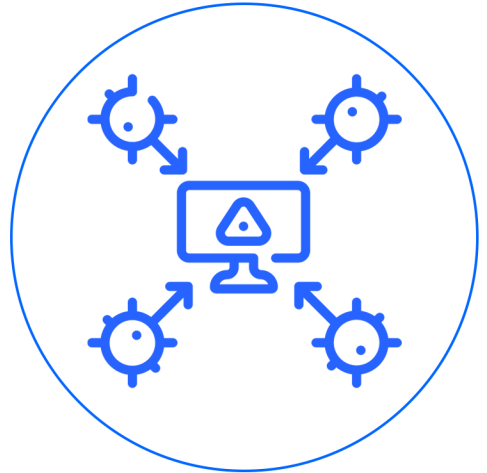

Fire system service

Fire system services involve installing maintaining, and inspecting equipment like fire alarms, sprinklers, and extinguishers to keep buildings safe. Regular checks ensure everything works properly, helping to prevent fires or reduce damage if one occurs. Technicians test the systems, fix any problems, and make sure they meet safety standards. This helps protect both people and property from fire hazards

Intruder systems service

Intruder systems are security solutions designed to detect and prevent unauthorized access to a property. These systems typically include alarms, motion detectors, door/window sensors, and surveillance cameras, which work together to alert homeowners or security personnel of any suspicious activity. Intruder systems can be monitored remotely, allowing for quick response times in case of a break-in or threat. Regular servicing ensures that all components are functioning properly, sensors are calibrated, and the system remains effective. Technicians also perform updates, troubleshoot issues, and make necessary repairs to maintain the system's reliability in protecting the property.

Smart Home service

Smart home services include the installation, setup, and maintenance of automated systems that control various aspects of a home, such as lighting, security, heating, and entertainment. These systems can be controlled remotely via smartphones or voice commands, offering convenience and energy efficiency. Smart home services ensure that all devices are connected, properly configured, and working smoothly. Technicians may also troubleshoot any issues, update software, and integrate new smart devices to enhance the home's functionality and security.

Security gates service

Security gates are physical barriers installed to control and restrict access to a property, providing an added layer of security. These gates can be manual or automated, often equipped with features like access control systems, intercoms, and surveillance cameras to ensure only authorized individuals can enter. Security gates are commonly used for residential homes, commercial properties, or gated communities. Regular maintenance and servicing are essential to keep them in good working condition, ensuring smooth operation, safety, and security. Technicians check for mechanical issues, ensure access control systems are functioning, and make any necessary adjustments to prevent unauthorized entry.

COMMUNICATION (IP TELEPHONE \$ INTERCOM)

Communication systems, including IP telephones and intercoms, are essential for smooth and secure communication within a property or business. IP telephones use internet protocols to enable voice communication over the internet, offering flexibility and cost savings compared to traditional phone systems. Intercoms, on the other hand, allow for audio or video communication between rooms or outside entrances, providing security and convenience. Regular servicing of these systems ensures that devices are functioning properly, software is up to date, and there are no connectivity issues. Technicians can troubleshoot, repair, and optimize these communication tools to ensure reliable, clear, and secure connections.

Network passive and active service

Network passive and active refer to two ways of monitoring a network. Passive monitoring means observing the network without interfering, collecting data like traffic patterns and security risks. Active monitoring involves sending test data through the network to check performance, find problems, and identify weak spots. Passive monitoring is about watching the network, while active monitoring involves testing it to make improvements. Both are important for keeping a network running smoothly.

Parking Solutions service

Parking solutions are systems designed to manage and optimize parking spaces, often using technology like automated barriers, ticketing machines, or mobile apps. These solutions help control access, monitor parking occupancy, and make the parking process more efficient for both drivers and property owners. Regular servicing ensures the systems run smoothly, preventing malfunctions and ensuring ease of use for customers. Technicians perform routine checks, repair any issues, and update the software to maintain a seamless parking experience

Central Satellite service

A central satellite typically refers to a main satellite in a network or system that acts as the central point for communication or control. It is responsible for managing data, coordinating signals, or distributing information to other satellites or ground stations. In some contexts, the term may also refer to a satellite positioned at the center of a network of satellites, where it serves as a hub for relaying signals or data between various satellites or users. These satellites are important in systems like GPS, communications, or Earth observation.

Sound systems service

Sound system services involve the installation, maintenance, and repair of audio equipment used for events, businesses, or home entertainment. This includes speakers, amplifiers, mixers, and microphones. Regular servicing ensures the sound quality remains clear and reliable, with technicians troubleshooting issues, calibrating the equipment, and making necessary repairs or upgrades. Routine checks help prevent malfunctions and ensure the system operates at its best, whether for everyday use or special events.

TimeLapes service

A time-lapse service creates videos that show changes over time in a short amount of time. It involves taking pictures or videos at regular intervals and then speeding them up. These services are used to capture things like construction progress, plant growth, or moving clouds. The service usually sets up cameras, takes the pictures, and then creates the final sped-up video. Time-lapse videos are great for showing slow changes in an interesting way.

Who we are!

Vision is one of the leading companies in implementing audio-visual security solutions and services, metal detection, theft and fire alarms, surveillance cameras, access control systems, attendance and departure devices, public address systems, audio and intercom systems in the Arab Republic of Egypt with the highest technologies in the world.

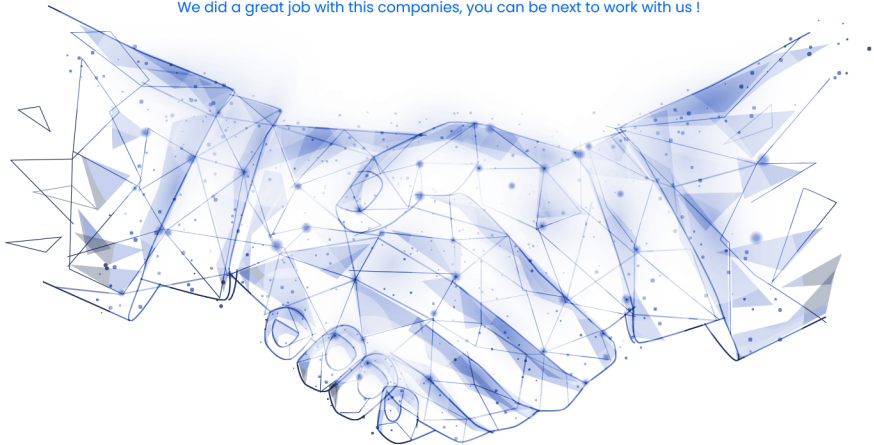

The positive feedback it receives from many customers who have used these has contributed to enhancing its reputation as one of the best companies specialized in the security fields.

The company provides its customers with a comprehensive range of wired and wireless audio-visual systems and security technology products, networks, programs, applications and tools.

Our services include installation, maintenance and upgrade of this system, and through the continuous improvement of these systems, good tangible results can be achieved and tools
